

Hello. I made a ERD diagram for a car dealership.

There are tables for the customers, Salespeople, mechanics and the cars inventory.

However, there are some tables that appear to be repeated, although they are not.

For instance, there is a CustomerS table and a Customer table. The Customers table is to provide an overview of all the individual customers at the dealership. The Customer table examines the individual customers and their service and purchase records.

The same principle applies to the MechanicsS and Mechanic table. MechanicS list each individual mechanic and their brief history. The Mechanic table shows each service that each individual mechanic has administered. MechanicS_ID and Mechanic_ID will be the same number.
